

Biofreeze Tube of Pain Relief Gel

Biofreeze has an active menthol ingredient which works to block pain associated with nerve impulses to the brain, thereby reducing the amount of pain that is felt.

Clinical trials show that Biofreeze is nearly twice as powerful as ice, however unlike ice, Biofreeze can be easily applied and does not require inactivity during the process.

Biofreeze is available in the form of 3 different applications, these take the form of a gel, roll-on and a spray.

Biofreeze is suitable for everyday use and for a variety of conditions; athletes and workers in physically demanding jobs may find Biofreeze to be particularly effective.

Unlike other cryotherapy products, Biofreeze is longer acting, with a single application of Biofreeze providing up to 3 hours of pain relief, this makes Biofreeze suitable for use on the go.

Some conditions that Biofreeze can be used to treat include:

- Arthritis
- Sore muscles
- Painful joints
- Backache
- Strains and sprains
- Inflammation
- Spasms

Biofreeze can be applied up to 4 times a day as needed.

Biofreeze Gel Pain Relief Features

The Biofreeze 112g / 118ml Gel tube contains a cryotherapy gel with an easy to use application which guarantees intense and fast acting pain relief. By spreading a thin layer of Biofreeze on the skin, a deep cooling and long-lasting sensation will work to relieve aches and strains in the muscles and joints. Biofreeze gel does not require additional massaging in or touch after the initial application. Biofreeze gel lasts longer than other high street equivalents due to its powerful formula, ensuring effective treatment for up to 3 hours, allowing for freedom to go about your day without the need for cumbersome reapplication. Only a small amount of gel is needed to provide powerful relief, meaning that the gel should last throughout the course of your recovery schedule. The screw cap on the tube prevents the gel from leaking, making Biofreeze gel ideal for traveling and gym use.
